Electric motors and common-mode currents

$$U_{cm,gl} = \min(U_{aN}, U_{bN}, U_{cN})$$

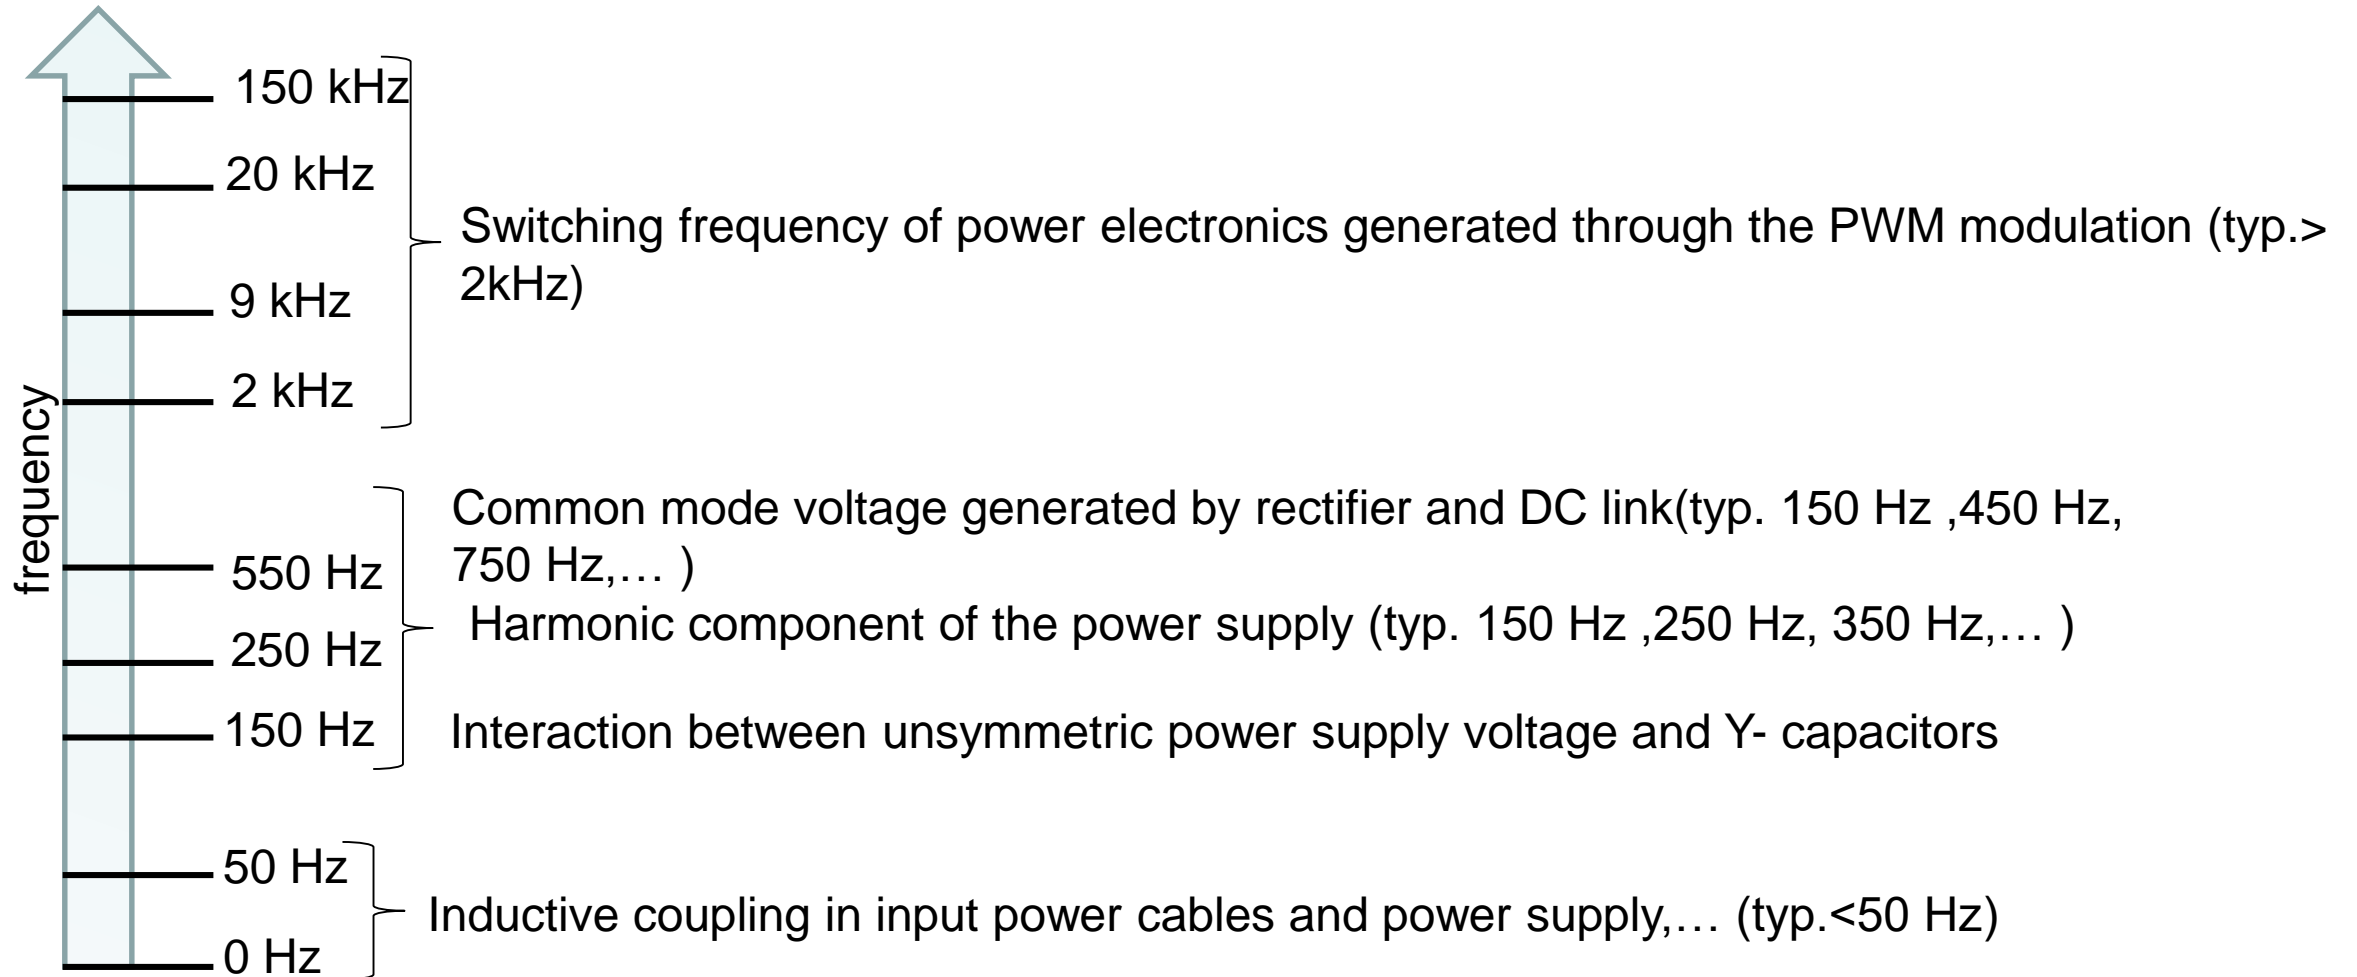

Common-mode voltage rectifier

Common-mode voltage due to inverter

$$U_{cm} = \frac{U_U + U_V + U_W}{3}$$

Frequency components of the common mode currents

Common-mode (CM) voltage of the inverter

$$U_{cm} = \frac{U_U + U_V + U_W}{3}$$

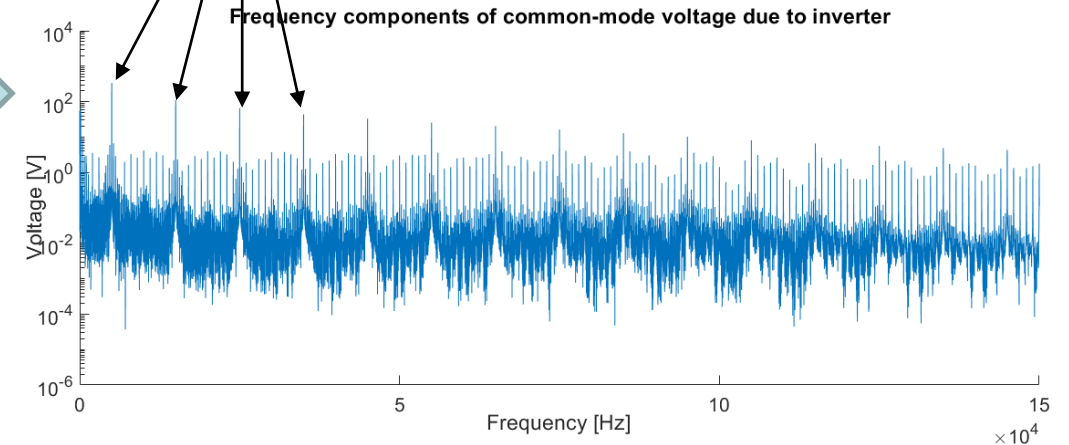

The CM voltage is a staircase function with step $\pm \frac{1}{3} U_{DC}$ (U_{DC} = DC Link voltage)

Fundamental wave and harmonics

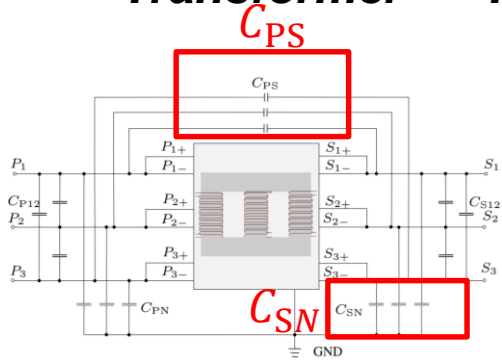

- Switching frequency (f_s) and harmonics ($3 \cdot f_s, 5 \cdot f_s$, etc)
- Modulation technique
- Topology of the inverter

- Inverter adds common-mode voltage components at the switching frequency and its harmonics
- The kind of modulation also influences the frequency components

Propagation Paths

Transformer

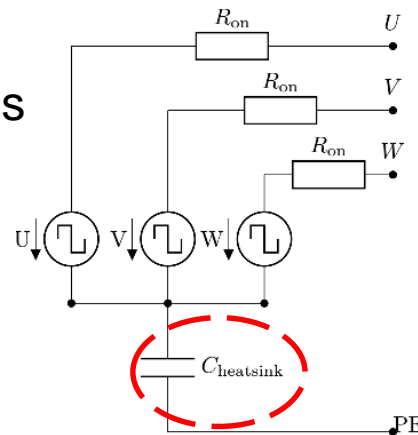

Input Cable

EMC Filter

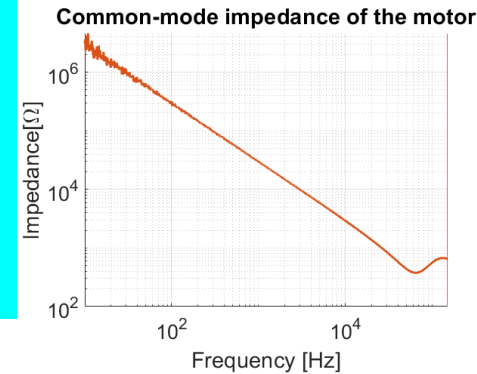

Converter

Output Cable

Motor

Induction motor
↓
Capacitive
behaviour for the
common-mode

- 2 possible paths for the common-mode current:
 - PE wire
 - Shield

- Path → Capacitance of the heatsink

- 2 possible paths for the common-mode
 - PE wire
 - N wire

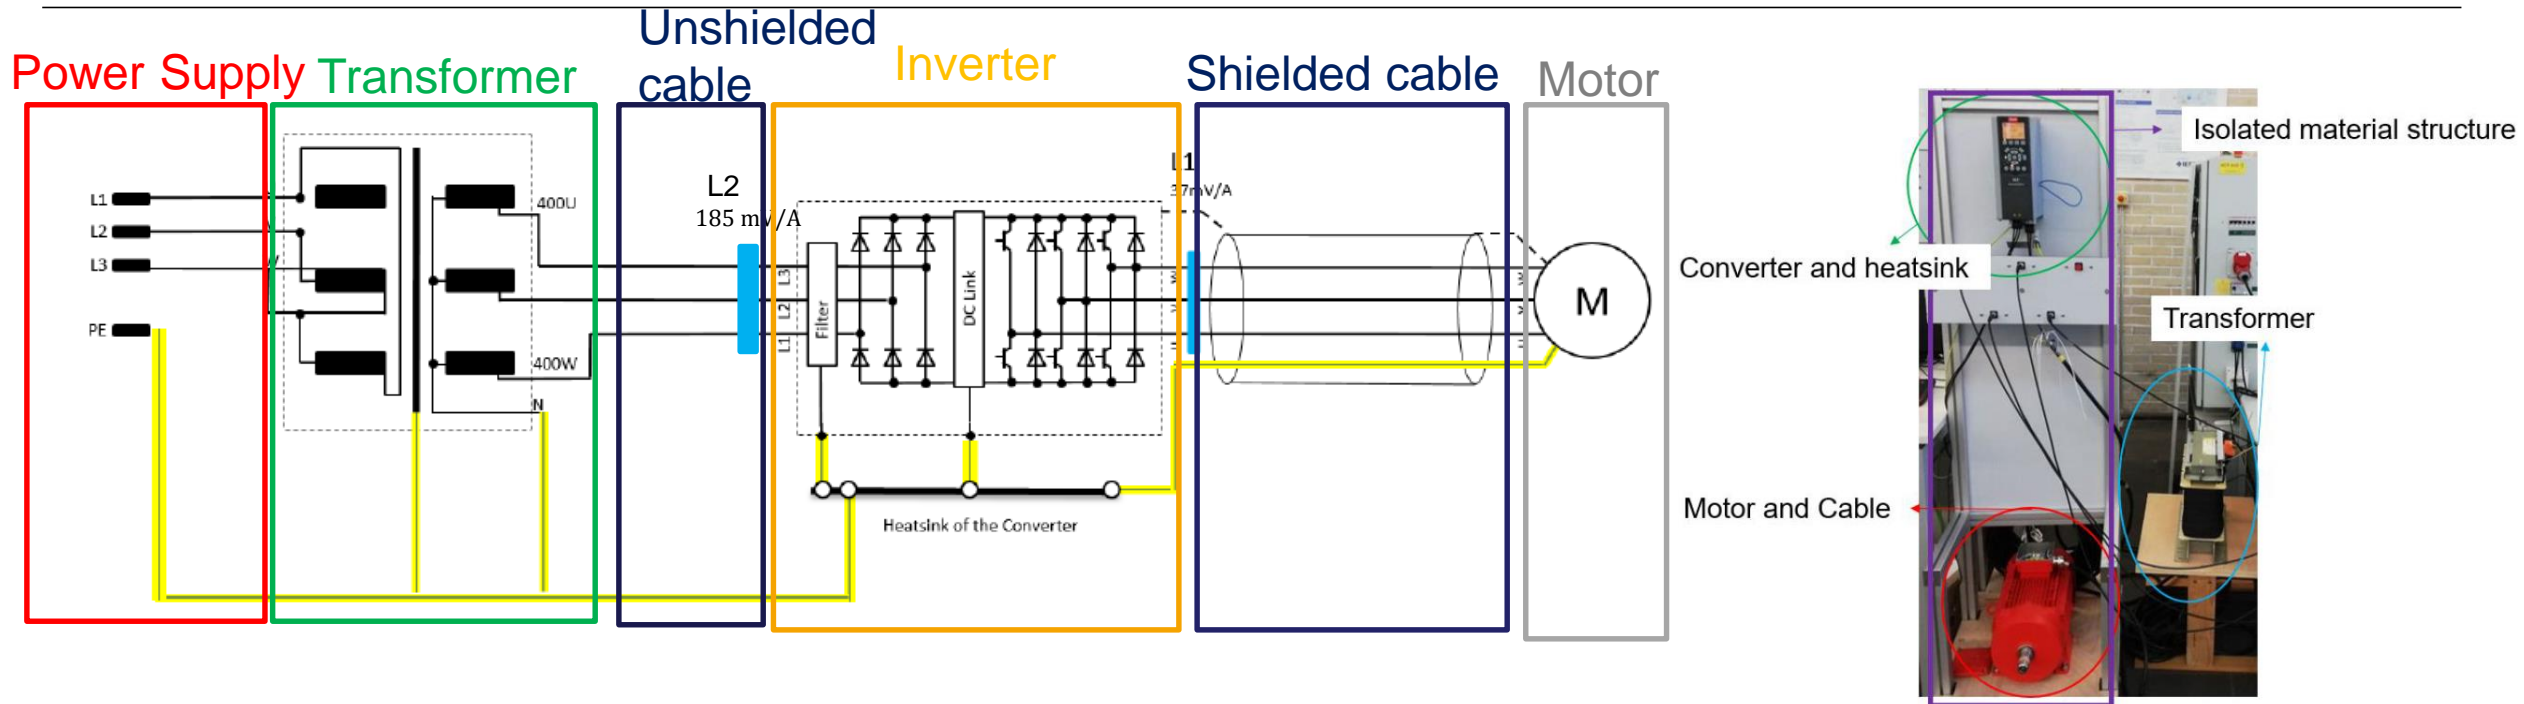

- C_y capacitances provides a path for the common-mode

- C_{ps} provides a coupling path for the common-mode between primary and secondary
- C_{ps} provides a coupling path for the common-mode between secondary side and ground

REFERENCE SYSTEM

Reference system

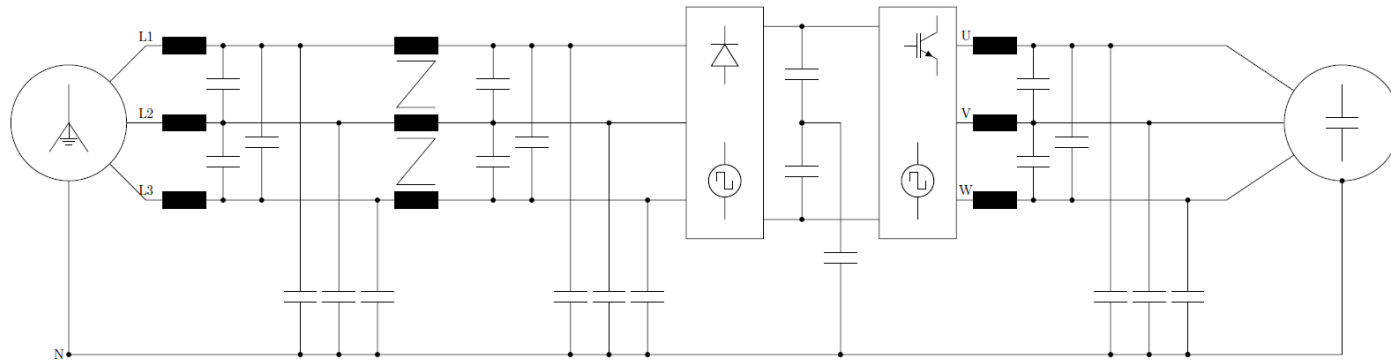

- The system is isolated → The whole common-mode current flows through the PE of the cable and the shield of the cable

PROPOSED MASTERTHESIS

EMI filter development for reduction of the common-mode voltage at the motor side

- The design of the filter to reduction of the CM voltage at the motor terminals has to be developed to work up to 150 kHz
- The development of the PCB and the testing has to be performed
- The effects on the leakage current have to be tested

Requisites:

- Knowledge of Matlab and Simulink
- PLECS knowledge is a plus
- Experience in PCB is also helpful for this task

Proposed EMI Filter configuration
